

Manage and Modify All Components Throughout the Enterprise from One Integrated Display

Regularly update domain account credentials referenced by components

Key Benefits

Enterprise Security

Optimizes security by changing credentials referenced by COM+, MTS, and DCOM objects at regular intervals.

Regulatory Compliance

Assures compliance with regulatory standards by enabling frequent, auditable changes to the domain account credentials referenced by components.

Increase Productivity

Increases IT staff productivity by modifying all COM objects in a single operation, eliminating time-consuming manual operations.

Key Features

Account Resets

Changes the accounts referenced by COM+ applications in a single step.

Retrieve Properties

Retrieves properties for COM+/MTS applications from all managed systems.

View Properties

Displays object GUIDs and identities in one integrated list.

Retrieve and View Objects

Retrieves and displays all DCOM objects for all managed systems in one integrated list.

Requirements

COM+ Manager requires the following minimum systems configurations:

- Windows NT 4.0, Windows 2000 (NT 5.0, Server, or Workstation), Windows XP (NT 5.1), Windows Server 2003 (NT 5.2), or Windows Vista.
- At least 64MB of memory and at least 10MB of free disk space.
- Screen resolution should be at least 800 x 600 to see all of the dialogs.
- Registry size should be at least 32MB.

Organizations running Windows servers embedded with COM+, MTS, and DCOM objects discover that effectively managing the identities used by these components is impractical. There is no convenient method to see every object on every machine at once, and no simple way to reconfigure them when necessary. With security best practices mandating that credentials be changed at regular intervals, the ability to collectively manage the identity information of all COM objects on every machine in the enterprise is essential.

COM+ Manager

COM+ Manager is a security management solution that administers COM, MTS, and DCOM objects en masse through a single display. Every object distributed across all systems in the network can be quickly identified and modified in one operation, eliminating the complexity of locating and changing all of these crucial security components manually. The process is completed thoroughly and with verifiable results, enabling more efficient use of IT resources.

For organizations that must conform to regulatory compliance standards of changing passwords throughout the enterprise on a regular basis COM+ Manager fills a niche void. Due to the large amount and wide distribution of COM objects in the enterprise, it is nearly impossible to know which objects are using which accounts. The task is often overlooked or ignored because of the difficulty in identifying all of the COM objects and the identities that they use. With COM+ Manager, the administrator can identify and list all of the COM objects in the enterprise in a single display, manage all of the component identities simultaneously, and ensure regulatory compliance.

Change the account that the COM, MTS/DCOM, and COM+ objects run under
