

Manage Scheduled Tasks on Your Windows Systems

Quickly Create, Update and Delete Maintenance Tasks across all your Windows hosts

KEY FEATURES

Manage Tasks

Modifies properties of existing tasks, and creates new tasks, for multiple systems, simultaneously.

Update AT Credentials

Changes the credentials used by the AT Service.

Status Monitoring

Provides real-time interactive feedback on the progress of a scheduled task.

Comprehensive Reporting

Records and archives the sites and settings of all tasks.

Scheduled Reboots

Schedules reboots and messages to managed systems, including remote machines.

Audited Logs

Retrieves and caches remote task activity, including task creations and modifications.

Deferred Processing

Re-tries operations on offline or unavailable systems automatically.

Security Updates

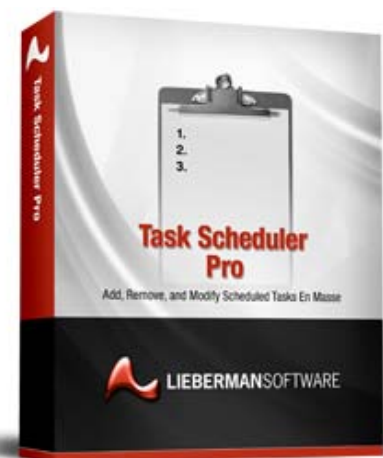

Deploys Windows and Internet Explorer security updates and hotfixes.

Application Deployment

Simplifies the ability to push and run applications, particularly patch deployment.

While the Windows operating system does include a built-in task scheduler, most systems administrators neglect this feature due to a lack of centralized enterprise management capabilities. This deficiency prevents IT staff at large organizations from quickly and comprehensively performing some of the most essential administrative tasks, such as running batch processes, clearing IE caches, defragmenting disks, or installing updates for applications, service packs or hotfixes, to all of the Windows systems in the network that need them. And if organizations use the same domain account to run scheduled tasks across multiple systems, it's difficult to find and change the credentials for these accounts, compromising security and reliability.

With **Task Scheduler Pro (TSP)** these functions can be executed on all managed Windows systems across the enterprise in a single operation, allowing crucial changes to be implemented immediately. Task Scheduler Pro enables systems administrators to **seamlessly add, remove and edit scheduled tasks en masse**. When maintaining tasks, Task Scheduler Pro can send the same set of files to every system in minutes. Tasks can be **run immediately or scheduled to execute at a specific time** using the Windows task scheduler service. These automated capabilities **simplify batch processing and on-going maintenance activities**, and can significantly increase IT staff productivity.

Try It Free

A fully functional trial version of Task Scheduler Pro is available for download. The trial lets you manage 10 computers for 30 days.

Password Changes

Task Scheduler Pro helps you to easily implement the **password change jobs** that are requirements of most security audits. With literally thousands of tasks (including many tasks that go undetected) running in most networks, Task Scheduler Pro is valuable for **showing you where these tasks are located**, and allowing you to modify information associated with the tasks, including their credentials.

Diagnostics and Troubleshooting

If your scheduled tasks fail to run as scheduled you can miss important batch processing, maintenance activities, security patches and program updates that are essential for maintaining an optimal IT infrastructure. Task Scheduler Pro includes comprehensive diagnostics information that lets you **troubleshoot these scheduled tasks disruptions**. It presents a multi-system linear view of the scheduled tasks folders on managed systems. At a glance, you can see which tasks stopped running, the machines they stopped running on, and the reason why they quit running. This means that your systems administrators can **pinpoint the issue causing scheduled tasks to stop running**, and then repair the problem – ensuring that all tasks continue operating on all managed Windows systems as intended.

Easily change AT service account credentials

Reporting and Compliance

Task Scheduler Pro generates an **audit trail with detailed logs of task creations and modifications**, which can be provided on demand to regulatory compliance auditors. **Built-in reports are available to help you quickly gather information on the Tasks and their status**, Windows service packs and hotfixes, and Internet Explorer service packs. Other reporting options include error reports of failed tasks, real-time interactive feedback on the progress of scheduled tasks, and more. An extensive report generator with text, CSV, or HTML output and email scheduling capability is also available.

Specifications

Task Scheduler Pro is a multi-threaded solution that **operates without deploying agents or scripts** to client machines. The tool gives IT administrators the ability to simultaneously manage their scheduled tasks

across all of their Windows systems concurrently from a central console.

Task Scheduler Pro Can Help You:

- **Mass manage the change and reporting process for Scheduled Tasks in Windows**
- **Enable effective enterprise management of tasks for batch processes, maintenance activities and program updates**
- **Diagnose and troubleshoot scheduled task failures**
- **Maintain regulatory compliance by auditing the credentials tied to each task**
- **Update the credentials used by the AT Service**
